If more than one search is submitted, please prioritize searches in order of need.

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Let us know what you already have and so do not need. Include the keywords, synonyms and meaning of acronyms. Define all terms that may have a specific meaning. Please attach a copy of the background, abstract, claims and other pertinent information.
Please state how the terms or keyword strings should relate to one another.

STG - (E1) Reissue Patent
AB - An electrographic sensor unit and method for determining the position of a user
selected position thereon. The electrographic sensor unit includes a layer of a
conductive material having an electrical resistivity and a surface, at least three
spaced apart contact points electrically interconnected with a layer of conductive
material, a processor connected to the spaced apart contacts and disposed to
selectively apply a signal to each of the contact points, and a probe assembly,
that includes either a stylus of a flexible conductive layer spaced apart from the
layer, coupled to the processor with the stylus disposed to be positioned by a user
in vicinity of a user selected position on the surface of the layer, or that position
being selected with a user's finger on the flexible layer and to receive signals
from the layer when the contact points have signals selectively applied thereto.
The user selected position is determined by the processor from signals received
from the stylus, or flexible layer, each in relation to a similar excitation of
different pairs of the contact points under control of the processor. The
conductive layer may be either two or three dimensional and may be a closed
three dimensional shape. There may also be multiple layers with the processor
being able to discern on which of those layers the user selected position is
located. Further, provision is made to correct the calculated coordinates of the

selected position for variations in contact resistance of each of the contact points individually. Additionally, a nonconductive skin having selected graphics printed thereon, such as a map, can be placed over the layer and the processor further convert the calculated coordinates of the selected position to coordinates that relate to the graphical information printed in the skin, and even electronically (e.g., audio or visual) present information to the user relative to the graphical location selected as the selected position.
